The Mole

## Objectives

$\square \quad$ State the value of Avogadro's number ( $6.02 \times 10^{23}$ ) .
$\square$ Use Avogadro's number as a unit factor to determine the number of particles, given the number of moles.
$\square$ Use Avogadro's number as a unit factor to determine the number of moles, given the number of particles.
$\square$ Calculate the molar mass of a substance given its chemical formula.
$\square \quad$ Use the molar mass as a unit factor to calculate the number of moles of a substance, given the mass of the substance.
$\square$ Use the molar mass as a unit factor to calculate the mass of a sample, given the number of moles of the substance.

## Objectives

$\square \quad$ State the value for the molar volume of a gas at STP ( $22.4 \mathrm{~L} / \mathrm{mol}$ ).
$\square$ Use the molar volume as a unit factor to calculate the number of moles of a gas, given the volume of the gas.
$\square$ Use the molar mass as a unit factor to calculate the volume of a gas, given the number of moles of the gas.
$\square$ Calculate the percent composition of a compound given its chemical formula.
$\square$ Determine the empirical formula of a compound, given its composition by mass.
$\square$ Determine the empirical formula of a compound, given its percent composition.

## Objectives

$\square$ Determine the molecular formula for a compound, given its empirical formula and molar mass.

## Measuring Things in Chunks

$\square$ Paper: 1 ream $=500$ sheets
$\square$ Eggs: 1 dozen $=12$ eggs
$\square$ Atoms: 1 mole $=6.02 \times 10^{23}$ atoms
$\square$ The quantity $6.02 \times 10^{23}$ is known as Avogadro's number.

## Mole - Particle Calculations

$\square$ Avogadro's number can be use as a unit factor to convert from the number of particles to the corresponding number of moles.
$\square$ Example:
$.25 \mathrm{~mol} \mathrm{O}_{2} \times 6.02 \times 10^{23}$ molecules of $\mathrm{O}_{2} / 1 \mathrm{~mol} \mathrm{O}_{2}$ $=1.51 \times 10^{23}$ molecules $\mathrm{O}_{2}$

## Mole - Mass Calculations

$\square$ Molar Mass - The mass in grams of an element that corresponds to 1 mole of the substance.
$\square$ The molar mass of an element is equal to its atomic mass in grams.
$\square$ Molar mass of a compound is calculated by adding together the molar masses of each of the elements that form it.
$\square$ Example:

- Molar mass of $\mathrm{Fe}_{2} \mathrm{O}_{3}$ :

$$
2(55.85 \mathrm{~g})+3(16.00 \mathrm{~g})=159.70 \mathrm{~g}
$$

## Mole - Mass Calculations

## $\square$ Examples:

Molar mass of $\mathrm{NH}_{3}$
$14.01 \mathrm{~g}+3(1.01 \mathrm{~g})=17.04 \mathrm{~g}$
Molar mass of $\mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}$
$24.31 \mathrm{~g}+2(14.01 \mathrm{~g})+6(16.00 \mathrm{~g})=148.33 \mathrm{~g}$
Mass of $2.01 \times 10^{22}$ atoms of Hg
$2.01 \times 10^{22}$ atoms $\mathrm{Hg} \times 1 \mathrm{~mol} \mathrm{Hg} / 6.02 \times 10^{23}$ atoms $\mathrm{Hg} \times 200.59 \mathrm{~g} \mathrm{Hg} / 1 \mathrm{~mol} \mathrm{Hg}=6.70 \mathrm{~g} \mathrm{Hg}$
Number of atoms in $.470 \mathrm{~g} \mathrm{O}_{2}$
$.470 \mathrm{~g} \mathrm{O}_{2} \mathrm{X} 1 \mathrm{~mol} \mathrm{O}_{2} / 32.00 \mathrm{~g} \mathrm{O}_{2} \mathrm{X}$
$6.02 \times 10^{23}$ molecules $\mathrm{O}_{2} / 1 \mathrm{~mol} \mathrm{O}_{2}=8.84 \times 10^{21}$ molecules $\mathrm{O}_{2}$

## Mole - Volume Calculations

$\square$ Molar Volume - The volume occupied by 1 mole of a gas at STP (Standard Temperature and Pressure), 273 K, 1 atmosphere pressure.
$\square$ The molar volume of a gas at STP is 22.4 L.
$\square$ Density:
Density $=$ Molar Mass (g)/Molar Volume (L)

## Mole - Volume Calculations

$\square$ Examples:

- Density of ammonia:
$\square D=M / V=17.04 \mathrm{~g} / 22.4 \mathrm{~L}=.761 \mathrm{~g} / \mathrm{L}$
- Mass of 3.36 L of $\mathrm{O}_{3}$ at STP:
- $3.36 \mathrm{~L} \mathrm{O}_{3} \times 1 \mathrm{~mol} \mathrm{O}_{3} / 22.4 \mathrm{~L} \mathrm{O}_{3} \times 48 \mathrm{~g} \mathrm{O}_{3} / 1 \mathrm{~mol} \mathrm{O}_{2}=$ $7.2 \mathrm{~g} \mathrm{O}_{3}$
- Number of molecules in $50.0 \mathrm{~mL} \mathrm{H}_{2}$ :
$\square 50.0 \mathrm{~mL} \mathrm{X} 1 \mathrm{~L} / 1000 \mathrm{~mL} \mathrm{X} 1 \mathrm{~mol} \mathrm{H}_{2} / 22.4 \mathrm{~L} \mathrm{H}_{2} \mathrm{X}$ $6.02 \times 10^{23}$ molecules $\mathrm{H}_{2} / 1 \mathrm{~mol} \mathrm{H}_{2}=1.34 \times 10^{21}$ molecules $\mathrm{H}_{2}$
- Molar mass of a gas with a density of $1.96 \mathrm{~g} / \mathrm{L}$ :
$\square D=M / V$
ㅁ $M=D V$
$\square M=(1.96 \mathrm{~g} / \mathrm{L})(22.4(\mathrm{~L} / \mathrm{mol})=43.9 \mathrm{~g} / \mathrm{mol}$

## Percent Composition

$\square$ The percent composition is a list of the mass percent of each element in a compound.
$\square$ To find the percent composition, assume that the sample contains one mole of the compound.
$\square$ The mass percent of each element is found by dividing the molar mass of the element present in the compound by the molar mass of the entire compound and multiplying by $100 \%$.

## Percent Composition

$\square$ Examples:

- Water $\mathrm{H}_{2} \mathrm{O}$
$\square 1$ mole of water contains 2 moles of hydrogen and 1 mole of oxygen.
$\square$ Molar mass of water: $2(1.01 \mathrm{~g})+1(16.00 \mathrm{~g})=18.02 \mathrm{~g}$
$\square$ Hydrogen: $[2(1.01 \mathrm{~g}) / 18.02 \mathrm{~g}] \times 100 \%=11.2 \%$
ㅁ Oxygen: $(16.00 \mathrm{~g} / 18.02 \mathrm{~g}) \times 100 \%=88.8 \%$
- TNT $\mathrm{C}_{7} \mathrm{H}_{5}\left(\mathrm{NO}_{2}\right)_{3}$
- C: 37.01\%

ㅁ H: 2.22\%
ㅁ $\mathrm{N}: 18.50 \%$
ㅁ 0: 42.26\%

## Determining Empirical Formulas

$\square$ From masses of reactants:

1. Find the number of moles of each element.
2. Find the smallest whole number ratio of the number of moles.
Example: $0.500 \mathrm{~g} \mathrm{Sc}, 0.767 \mathrm{~g} \mathrm{Sc}_{x} \mathrm{O}_{y}$
$\square 0.500 \mathrm{~g} \mathrm{Sc} \times 1 \mathrm{~mol} \mathrm{Sc} / 44.96 \mathrm{~g} \mathrm{Sc}=$ 0.0111 mol Sc
$\square 0.267 \mathrm{~g} \mathrm{OX} 1 \mathrm{~mol} \mathrm{O} / 16 \mathrm{~g} \mathrm{O}=0.0167 \mathrm{~mol} \mathrm{O}$
$\square$ Smallest whole number ratio: 2:3
$\square$ Empirical formula: $\mathrm{Sc}_{2} \mathrm{O}_{3}$

## Determining Empirical Formulas

$\square$ From percent composition:

1. Assume the sample has a mass of 100 g .
2. Find the number of moles of each element.
3. Find the smallest whole number ratio of the number of moles.
Example: 92.2\% carbon, 7.83\% hydrogen $92.2 \mathrm{~g} \mathrm{C} \mathrm{X} 1 \mathrm{~mol} \mathrm{C} / 12.01 \mathrm{~g} \mathrm{C}=7.68 \mathrm{~mol} \mathrm{C}$ $7.83 \mathrm{~g} \mathrm{HX} 1 \mathrm{~mol} \mathrm{H} / 1.01 \mathrm{~g} \mathrm{H}=7.75 \mathrm{~mol} \mathrm{H}$ Smallest whole number ratio: $1: 1$ Empirical formula: CH

## Determining Molecular Formulas

$\square$ From the molar mass and empirical formula.

1. Find the molar mass experimentally.
2. Divide the molar mass of the empirical formula into the experimentally determined molar mass.
3. Multiply the number of atoms of each element in the empirical formula by the ratio found in step 2.
Example: Fructose Empirical formula $\mathrm{CH}_{2} \mathrm{O}$, Molar mass
$180 \mathrm{~g} / \mathrm{mol}$
Empirical molar mass: $12.00 \mathrm{~g}+2(1.01 \mathrm{~g})+16.00 \mathrm{~g}=$ $30 \mathrm{~g} / \mathrm{mol}$
Ratio: $180 \mathrm{~g} / \mathrm{mol} / 30 \mathrm{~g} / \mathrm{mol}=6$ Molecular formula: $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$
